

In this essay I am going to be arguing in support of, destroying cane toads. I have read many articles which have persuaded me that these pests are deadly evils. I will also balance this argument in favour of these creatures however this main viewpoint these monsters.

From my research I have been looking at cane toad news articles. Most of the information in the news articles was backing calls to destroy these ambitious amphibians. They are demolishing the native species of Australia. For these vile creatures to be halted they must be immediately exterminated.

Cane toads are, Slimy Smelly creatures, which are covered with warts, poisonous glands and horrible skin. They were transported into Australia in 1935 to keep down the population of cane toad beetles and defend the sugar plantation. Unfortunately this plan didn't go as expected because the cane toad colony began to expand.

Why are they a pest? First they are harmful to native Australia wild life. Jonathan pearlman says, "predators that try to kill them... have been killed by the cane toads poison." (Jonathan pearlman 2012) This suggests that animals that try to eat them will unfortunately die because of their poisonous skin. The Epoch times says, "The pests have spread since 1935." (The Epoch times 2006)

There is not much information to support the cane toads. All I could find was the best way to get rid of them. It is said that we should kill them in a more humanely way such as paralysing them with haemorrhoid cream "egg in a freezer and the job is done humanely." (phil merer 2006)

It is clear from my research information that cane toad do not have many allies. This leads to concluding that cane toads must be immediately exterminated or there will be no more native animals left in Australia.

The Epoch times Australia look for ways to end cane toad menace August 5th (2008)
